

Test-1

① What is HTML?

② HTML is stand for hyper text markup language and it is used to create and structure the webpage.

HTML

HTML is contain the data or information in the tags and elements that are Root element, container elements (head, body), child element (img)

markup language

HTML is a markup language because the structure content using elements enclosed in tags.

tags-

Tags are tell the browser how to display the text and media.

2) ~~HTH~~ HTML & HTML5

HTML	HTML5
① older version	new version
② less API support	Datatype small
③ Datatype large	large API support
④ limited multimedia	unlimited multimedia
⑤ no semantic tags	semantic tags are used
⑥ limited Input type	unlimited Input type.

Q) What is the purpose of `<!DOCTYPE html>`?

*) `<!DOCTYPE html>` is used to declare the document type and tell browser the web page is made in HTML5.

*) If the doctype is different b/w tags & element

*) If the doctype is given the browser goes to Quirks mode and it causes render problem.

Q) What is the diff. b/w tags and elements in HTML?

Tags

Tags are predefined keyword in HTML. Enclosed in angle bracket (`<>`)

Angle bracket and a keyword

Element

That the element contains opening tag & closing tag & content in element.

Full structure of content

*) Start tag + content + end tag.

Q) What are semantic tags? Eg.

*) Semantic tags are HTML tags that clearly describe the meaning and purpose of the content inside them.

*) They help browsers, developer and search engines understand the structure of a webpage.

*) Improve webpage structure

*) Easy to read & maintain code.

Q) what is difference b/w semantic & non semantic tags?

Semantic tags:

*) It has meaning

*) describe the purpose & meaning of content.

*) It have specific attribute structure

Non semantic tags:

*) It not have any meaning

*) It contain anything

*) It has "class" attribute to work in structure.

Q) what are meta tags and why are they are?

*) meta tags are provide information about the webpage into the Browser and not display directly in webpage & show browser & search engine.

*) It is introduced in HTML5

*) It mainly used for SEO related purpose and they understand the browser easily.

Q) why do we use the <source> tag inside audio & video tags?

*) <source> tags are used to support different audio and video format like mp4, webm, ogg and it allow you to list multiple file version.

*) And we control in this process to show audio and video file in web pages it contain source, src, type.

Q) What is iframe & Where is it used in real-time application?

- *) The iframe tags are specifies the inline frame
- *) The inline frame is used to embed another document within the current HTML document.
- *) If a webpage some content are give but not understand the user that time some embed Youtube video on your webpages it easy to understand.

(b) What is the different between block-level element & inline element.

Block level

- *) It always start in new line
- *) It like a container to hold the many content or tags inside the block level.
- *) It always take a full width of screen
- *) Block level are building your basic structure.

Inline level

- *) It not start in new line
- *) It take content width.

*) Inside a inline you can will add any inline

tags.

- *) You can not add inside inline never add a block level element.
